

Contactless secure

Due to increasing crime figures regarding theft, sabotage acts or manipulation there is a high demand for access control systems. Access control systems allow only certain persons to enter special security areas.

Therefore ZeitControl offers a contactless working access control system that has been developed in order to protect these areas against unauthorized access.

MagicKey is a stand-alone RFID based system. The RFID transponders are available in various designs. They can be read by MagicKey within a range of 5 to 8 cm and will be compared with a list of known RFID transponders. Depending on the result of this comparison, a door opener is activated.

The list of known RFID transponders can hold up to 1000 transponders.

MagicKey is easy to install and to configure. No maintenance is required. It is available as in-wall or on-wall version.
