

## TimeStamp – Time and Attendance

ZeitControl cardsystems GmbH presents two new terminals for time and door attendance. These terminals are suitable for software and system houses for the connection to existing software.

The **TimeStamp** is available in two new versions: TimeStamp RFID for reading RFID-transponders and TimeStamp Chipcard. Both versions can be used in the time registration and attendance. We recommend the contactless RFID version, because it works also in a dusty environment.

These terminals from our own production are fitted out with an extremely versatile equipment like RS232/RS485 – interface, modem connection, LED-display with 2x16 characters, keypad with 14 keys as well as 60 kBytes of memory.

All applications can be realized in the area of working times, the project times and access control.
