## EASY READING OF RFID SERIAL ID-NUMBERS

The TagTracer MicroStick Multi by ZeitControl is a RFID reader for 125 kHz transponder tags.

This newly developed RFID-USB stick reads the transponder's serial ID number and transmits it directly into the PC's keyboard buffer. The serial number then appears wherever the cursor is currently located: e.g. in Word®, Excel®, or any other software, just as if it was typed on the keyboard.

With the same dimensions as a normal USB memory stick, the TagTracer MicroStick Multi is easily connected to an USB port via Plug&Play. Neither a device driver nor any administrative rights are required.

Due to its small size and the easy(-to-use) handling this device can perfectly be used for applications in logistics, administrative processes in the transportation field, or product identification.

A desktop version / variation of this product with same technical functions will soon be available.

For any further details please look at [www.transponder.de](http://www.transponder.de).
